JOB MARKET PAPER

Energy Misallocation and Aggregate Productivity: Evidence from Canada ([View](#)) ([SSRN](#))

Abstract: This paper quantifies aggregate productivity losses from energy misallocation. While energy is an essential input, the aggregate productivity effects of its misallocation remain largely unknown. Unlike capital and labor, energy is geographically less mobile, heavily regulated, and exhibits significant interregional disparities. These characteristics make energy misallocation particularly relevant for productivity. I incorporate energy as a third input into the standard misallocation framework and quantify productivity losses using Canadian provincial input-output data from 2014-2020. I examine misallocation at the province-by-sector level to capture both sectoral and regional variation across the entire economy. I decompose productivity losses into within- and between-sector components and calculate the contribution of each input separately. I find that aggregate productivity could be 5-8% higher under an optimal allocation of all inputs. Most of the losses are driven by interprovincial misallocation. Energy, despite its relatively small input share, accounts for up to one-third of these losses. Its contribution exceeds labor and is comparable to capital. This suggests that energy misallocation is an important and underexplored source of productivity losses.
